CYBER SAFETY SIMPLIFIED

OSINT CTF Writeups

DEPIX

Target Information

A passenger posted a photo of their flight ticket online.

The ticket is heavily pixelated, but key details remain partially recoverable.

Your task is to identify:

- The passenger's first and last name
- The seat number
- The arrival airport IATA code
- All information can be deduced through lawful open-source intelligence techniques.

Objective

- Using only legal OSINT methods, extract the required information from the depixelated ticket.
- Your final answer must follow this exact format, in this exact order:
OSINT{NAME_SURNAME_SEATNUMBER_AIRPORTIATA}
- Example format (not the solution):
OSINT{JOHN_DOE_14A_JFK}

Rules

- Use only legal, open-source methods
- No contact with any individuals
- No intrusion or unauthorized access

Solution:

- Collecting clue from the given image.
- After analyzing the image, one key piece of information stood out: the “date” and “LAX” on the flight ticket showing 09 JUN 13.
- After collecting information from the clue i simply used Yandex to reverse image search

- The first image looking same like challenge image so i openend it

- Here is the real image of this boarding pass with name, surname, seat number and airport

So the flag is `OSINT{MICHAEL_CHEN_3D_PVG}`

HOLEHE & THE SECRET EMAIL

Description

- You are investigating the origins of a popular OSINT tool used to pivot from email addresses to online accounts: Holehe.
- Behind every tool, there is a creator — and behind that creator, there is an email address.
- Your mission is to trace back the very first appearance of the creator's email address online and determine the exact date it was created.

Objective

- Using open-source intelligence only, find:
- The creator of Holehe
- The public email address used for Holehe
- The exact creation date of this email address
- The final flag must be based only on this date.

Flag Format

- OSINT{DD-MM-YYYY}
- Example (not the real answer):
- OSINT{01-01-2020}

Rules

- Use only legal, open-source information
- Do not contact the developer
- No exploitation, intrusion, OSINT only
- Everything can be found through:
- Code repositories
- Public profiles
- Archives
- Lawful OSINT sources

Solution

- I started by searching for the Holehe GitHub repository to identify who developed the tool.

- The repository owner was **megadose**, confirming the creator of Holehe.
- Next, I visited the GitHub profile of megadose and reviewed the available repositories. Instead of looking only at the Holehe project, I checked older repositories because they were more likely to contain public contact information.

- While examining the repositories, I found Toutatis. After reviewing its commit history, I opened the commit that added the CODE_OF_CONDUCT.md file.

```
56 + Examples of representing our community include using an official e-mail
57 + address,
58 + posting via an official social media account, or acting as an appointed
59 + representative at an online or offline event.
60 +
61 + ## Enforcement
62 +
63 + Instances of abusive, harassing, or otherwise unacceptable behavior may
64 + be
65 + reported to the community leaders responsible for enforcement at
66 + [megadose@protonmail.com](mailto:megadose@protonmail.com).
67 + All complaints will be reviewed and investigated promptly and fairly.
68 +
69 + All community leaders are obligated to respect the privacy and security
70 + of the
71 + reporter of any incident.
72 +
73 + ## Enforcement Guidelines
74 +
75 + Community leaders will follow these Community Impact Guidelines in
76 + determining
77 + the consequences for any action they deem in violation of this Code of
78 + Conduct:
```

- Inside the CODE_OF_CONDUCT.md file, the developer had included a public contact email.
- Email Found: megadose@protonmail.com
- After obtaining the email address, I searched for information that could reveal when the account was created. Since ProtonMail does not publicly display account creation dates, I used its public PGP key lookup service.

<https://api.protonmail.ch/pks/lookup?op=index&search=megadose@protonmail.com>

```
info:1:1
pub:b2e481ef07765693a8ccd8d1b0e29d2cac738595:22:1610617266::
uid:megadose@protonmail.com <megadose@protonmail.com>:1610617266::
```

- The response contained a Unix timestamp associated with the public key.

[1610617266](#)

- I converted this Unix timestamp into a readable date using an date command in my linux for date converting.

- The converted date was:

14-01-2021

- Using this date, I created the final flag.

Flag : OSINT{14-01-2021}

A TASTE OF INFLUENCE — PART 2

- Following the identification of the gastronomic event, investigators expand their scope.
- The individual is known to maintain an online presence across multiple platforms. Investigators believe that a personal email address can be identified using publicly available information, although it is not explicitly displayed on his main profile.
- Your task is to analyze open sources and determine which email address is associated with this individual.

Input

- Public professional profile:
- <https://gronda.com/@konstantin-gladkix>

Mission

- Identify the email address linked to this individual.

Flag Format

- OSINT{EMAIL_ADDRESS}

Rules

- All uppercase
- Replace @ with _AT_
- Replace . with _DOT_
- No spaces

- **Solution**

The investigation began by reviewing the provided Gronda profile, which revealed the individual's full name and current role as a Sous Chef at Sinara Center. These details were used as the primary pivot points to identify the person's presence on other publicly accessible platforms.

- A search using the individual's name led to several matching social media profiles, including Instagram and Facebook. The Facebook profile was examined to identify any publicly available contact information or additional clues that could assist the investigation. Although it confirmed the individual's identity through similar culinary-related content, it did not provide any useful information that advanced the investigation.
- The Instagram profile was then reviewed using the mobile application. After confirming that it belonged to the same individual, the Contact Information section available on the profile was accessed. Unlike the web version, the mobile application exposed additional contact details, where the associated email address was publicly available.
- The recovered email address was then used as the final answer and converted into the required challenge flag format according to the provided instructions.

- Putting Flag `OSINT{K_DOT_GLADKIH_AT_MAIL_DOT_RU}`

30

A TASTE OF INFLUENCE — PART 3

- Investigators suspect that the individual reuses identifiers across different online services.
- Using information gathered in the previous part, your task is to determine the last four digits of the phone number associated with this individual, if publicly accessible.

Input

- Previously identified email address

Mission

- Identify the last four digits of the phone number.

Flag Format

- OSINT{XXXX}

Rules

- Numbers only
- Exactly four digits

Solution

The investigation continued using the previously identified Instagram profile of the target. The profile was opened in the Instagram mobile application, where additional contact details were available through the Contact Info section. By accessing this section, the associated phone number was revealed. The last four digits of the displayed phone number were extracted and submitted as the final answer for the challenge.

- Putting Flag **OSINT{5410}**
